

API Documentation

Restaurant Management System

API Documentation

1. Menu API

Endpoint

`/api/menu.php`

Method

GET

Description

Returns the list of all available food items from the restaurant menu in JSON format.

Sample Request

`http://localhost/Restaurant-Management-System/api/menu.php`

Sample Response

```
[
  {
    "id": 1,
    "food_name": "Burger",
    "description": "Veg Burger",
    "price": "120",
    "category": "Veg"
  }
]
```

2. Orders API

Endpoint

`/api/orders.php`

Method

GET

Description

Returns all customer orders stored in the database.

Sample Request

`http://localhost/Restaurant-Management-System/api/orders.php`

Sample Response

```
[
  {
    "order_id": 5,
    "customer": "Mohammed Arman",
    "total": 450,
    "status": "Preparing"
  }
]
```

3. Reservations API

Endpoint

`/api/reservations.php`

Method

GET

Description

Returns all table reservations made by customers.

Sample Request

`http://localhost/Restaurant-Management-System/api/reservations.php`

Sample Response

```
[
  {
    "reservation_id": 3,
    "customer": "Mohammed Arman",
    "table_no": 4,
    "date": "2026-07-18",
    "time": "19:00"
  }
]
```

Response Format

All APIs return data in:

JSON (JavaScript Object Notation)

Example:

```
{  
  "id":1,  
  "food_name":"Burger",  
  "price":"120"  
}
```

Purpose of APIs

These REST APIs provide restaurant data in JSON format. They can be used by external applications such as mobile apps or other web applications to access menu items, orders, and reservation information without directly accessing the database.
